

You must develop an application using Android Views with the following features:

- It must contain 3 images, a background image, a text and a button.
- Initially the button will show the text "Push me if you can" and when pressed, it will change the text to "You have pressed me X times", counting the times it is pressed and updating the button message.
- Every time the button is pressed, the images will rotate to a different place, always following the same pattern (from left to right, from right to left, from top to bottom ... as you wish)
- When user presses the button 5 times only one image frame will remain, with a partial transparent content, showing different images while user keeps pressing the button

You must properly use the resources (string, drawable, themes ...).

The structure of the Android configuration and layout files must be correct, as well as the structure of the project and the storage of resources.

Do your own implementation, do not copy the one below. Images can be arranged in different positions, text can have a different view ...
